

EPS is pleasant and easy to handle

Building professionals all agree: EPS is extremely pleasant and easy to handle. On the one hand, it is ultra-light – an insulation package with roughly a quarter of a cubic metre weighs only 3.5 to 6 kg. In addition, it can be cut to shape quickly and cleanly.

- The construction of large flat roofs requires considerable manipulation. For this reason, roofing professionals swear by light-weight EPS insulation boards.

- Façade insulation boards for thermal insulation composite systems (ETICS) can be precision-cut to size and shape quickly and with no dust.
